CLIMATE SOLUTIONS

## Master coolers BC 340 make cows happy!

Quick installation, low running costs as well as high efficiency make portable coolers the ideal solution for cooling utility and livestock buildings. Last days we received some nice photos from cows stable where Master BC 340 coolers were installed.

During summer the dairy cows usually suffer from heat. It can significantly affect the milk production which can be dramatically decreased by very hot weather. Master coolers help to keep a comfortable temperature level inside the stable and to increase cows' productivity then.

Master evaporative coolers are perfect solution for agriculture as lots of farm and livestock buildings are poorly insulated and usually semi-open. Traditional air conditioners are useless for such applications because of high loss of cold air. They can be also harmful for animals. Master air coolers provide a fresh and healthy environment. Their robust construction making them highly resistant to damages and low running costs may appeal to many animals breeders as well.
